

POLYBUTADIENE COMPOSITION

15 The polybutadiene composition of the present invention can be produced, for example, by melt-kneading the polybutadiene type polymer and the compound (I-1), compound (I-2), compound (II) or the benzoin compound. More specifically, it can be produced by adding any one of the compounds as listed above to the melt-kneaded polybutadiene type
20 polymer, followed by further melt-kneading, thereby the compound is uniformly dispersed in the polybutadiene composition, or by blending the polybutadiene type polymer and the compound and optionally further additives to obtain a composition, met-kneading the same and extruding the melted composition. Alternatively, the compound can be added while
25 the polymerization reaction for producing the polybutadiene type polymer is under progress or immediately after the end of the polymerization reaction. The compound may be added as a solid state or as a solution of the compound in a solvent.

When an antioxidant and/or another additive are added to the composition, the compound may also be added at the same time. When they are added at the same time, the compound may be dissolved in a heat-melted antioxidant and/or other additive. If the antioxidant and/or other additive are in liquid state, the compound may be dissolved or dispersed in them.

The present composition thus produced is typically melted at 150°C or higher, preferably 170°C or higher. The upper limit of the temperature is may be set within such a temperature range where decomposition of the polybutadiene polymer and the compound does not occur, and is typically 250°C or lower, preferably 220°C or lower.

Production of the molded articles from the composition of the present invention can be accomplished by a conventional method such as injection molding, extruding molding, blow molding or the like.

The appearances of the articles molded from the present polybutadiene composition such as hoses, footwear, toys, films and various vessels produced by various molding methods such as injection molding, extruding, blow molding or the like, is improved.

The present invention will be explained in more detail with the following examples, which should not be construed to limit the scope of the invention.

Examples 1

To 100 parts by weight of styrene-butadiene block copolymer powder [styrene-unit content: 75wt%, butadiene-unit content: 25wt%, clear pale yellow, manufactured by Philipps Company, Limited under the trade name "K-Resin KR-051"], is added 0.1 part by weight of 2-chromanone (powder), and the resulting mixture was melt kneaded at 200°C for 2

minutes with 30 mm ϕ mono-axial extruder to obtain pelletized styrene-butadiene copolymer composition. The melt flow rate, MFR of the palletized composition was measured with a melt-indexer (L246-2531) at 260°C, residence time being 15 minutes and the load being 2160 g and found to be 33g/10min. The greater the MFR value, the more fluid the composition is and the less the gel is formed.

The obtained pellets are melt kneaded and injection molded to produce an article with good appearance and no gel product.

Example 2

Styrene-butadiene copolymer was obtained by conducting an experiment in a similar manner as in Example 1, except that 0.1 part by weight of 2-phenyl-4-chromanone (powder) was used in place of 2-chromanone. MFR of the obtained composition was measured in a similar manner as in Example 1 and found to be 27g /10 min.

The pellets obtained as above is melt-kneaded and injection-molded to produce an article with good appearance and having little gel product.

Comparative example 1

Pellets of the styrene-butadiene block copolymer was obtained in a similar manner as in Example 1 except that 2-chromanone was not used. MFR of the pellets was measured with the melt-indexer (L246-2531) as used above at 260°C, the residence time 15 minutes and the load being 2160 g, and found to be 4g/10 min. The melt flow rate means that gel products are formed. The obtained pellets are melt-kneaded and injection-molded to give a molded article with many gel products and minute convex portions are formed.

The results are shown in Table 1.

The greater the MFR value, the more fluid the composition is and the less the gel is formed.

The obtained pellets are melt kneaded and injection molded to produce an article with good appearance and no gel product.

- 20 copolymer composition. The melt flow rate, MFR of the palletized composition was measured with a melt-indexer(L246-2531) at 260°C, residence time being 15 minutes and the load being 2160 g and found to be 38g/10min. The greater the MFR value, the more fluid the composition is
